

# A Clear Picture of Lens Laws

Sebastian Fischer  
2015

scale  
width  
only

scaled to same width

scale  
nicely

$\text{scaleWidth} : \text{Pic} \rightarrow \text{Width} \rightarrow \text{Pic}$

$\text{scaleNicely} : \text{Pic} \rightarrow \text{Width} \rightarrow \text{Pic}$

$\text{width} : \text{Pic} \rightarrow \text{Width}$

(in Haskell-like notation)

# Bidirectional Correspondence

$$\text{width}(\text{scaleWidth } p \ w) = w$$

$$\text{scaleWidth } p(\text{width } p) = p$$

$$\text{width}(\text{scaleNicely } p \ w) = w$$

$$\text{scaleNicely } p(\text{width } p) = p$$

# Generally

$\text{put} : \text{Source} \rightarrow \text{View} \rightarrow \text{Source}$

$\text{get} : \text{Source} \rightarrow \text{View}$

$\text{PutGet} : \text{get} (\text{put } s \ v) = v$

$\text{GetPut} : \text{put } s (\text{get } s) = s$

→ well-behaved lens

As not every combination of  
put and get functions is  
well-behaved, which part is  
redundant?

(put is not!)

get is redundant

Let  $(\text{put}_1, \text{get}_1)$  and  $(\text{put}_2, \text{get}_2)$  be well-behaved.

Then for all sources  $s$ :

$$\begin{aligned} & \text{get}_1 s \\ = & \text{get}_1 (\text{put } s (\text{get}_2 s)) (\text{Get Put}_2) \\ = & \text{get}_2 s (\text{Put Get}_1) \end{aligned}$$

So, in a well-behaved lens,  $get$  is determined by  $put$ .

But, when does a corresponding  $get$  exist for an arbitrary given function  $put : Source \rightarrow View \rightarrow Source$ ?

(such that they form a well-behaved lens)

Looking at put alone

$\text{scaleNot} : \text{Pic} \rightarrow \text{Width} \rightarrow \text{Pic}$

$\text{scaleNot } p \ w = p$

Is there a corresponding get function?

# Part Injectivity

scaleWidth  $p : \text{Width} \rightarrow \text{Pic}$

gives different results for different widths

scaleNicely  $p : \text{Width} \rightarrow \text{Pic}$

gives different results for different widths

scaleNot  $p : \text{Width} \rightarrow \text{Pic}$

gives same result for different widths

Put injectivity is implied  
by lens laws (proof omitted)

→ It is a necessary condition  
on put functions in  
well-behaved lenses

No corresponding get for

$\text{scaleNot} : \text{Pic} \rightarrow \text{width} \rightarrow \text{Pic}$

$\text{scaleNot } p \ w = p$

because  $\text{putInjectivity}$  does not hold.

# Looking at put alone

scaleBy : Pic  $\rightarrow$  Factor  $\rightarrow$  Pic

scaleBy p x =

scaleNicely p (x.width p)

Is there a corresponding get function?

# Put Twice

$$\text{scaleWidth}(\text{scaleWidth } p \ w) \ w \\ = \text{scaleWidth } p \ w$$

$$\text{scaleNicerly}(\text{scaleNicerly } p \ w) \ w \\ = \text{scaleNicerly } p \ w$$

but

$$\text{scaleBy}(\text{scaleBy } p \ 2) \ 2 \\ = \text{scaleBy } p \ 4 \\ \neq \text{scaleBy } p \ 2$$

**PutTwice** is implied by lens laws:

$$\begin{aligned} & \text{put (put s v) v} \\ = & \text{put (put s v) (get (put s v)) (PutGet)} \\ = & \text{put s v (GetPut)} \end{aligned}$$

→ It is a necessary condition on **put** functions in well-behaved lenses.

No corresponding get for

$\text{scaleBy} : \text{Pic} \rightarrow \text{Factor} \rightarrow \text{Pic}$

because  $\text{putTwice}$  does not hold.

(  $\text{scaleBy}$  satisfies  $\text{putInjectivity}$  and  
 $\text{scaleNot}$  satisfies  $\text{putTwice}$  )

Looking at put alone

ScaleBlank : Pic  $\rightarrow$  Width  $\rightarrow$  Pic

ScaleBlank p w =

ScaleNicely sameBlankPic w

Is there a corresponding get function?

# Put Surjectivity

every picture is result of `scaleWidth`  
(by scaling itself with its own width)

every picture is result of `scaleNicely`  
(by scaling itself with its own width)

not every picture is result of `scaleBlank`  
(because every result is blank)

$\text{PutSurjectivity}$  is implied by  
lens laws (proof omitted)

→ It is a necessary condition on  
 $\text{put}$  functions in well-behaved  
lenses.

No corresponding get for

scaleBlank: Pic  $\rightarrow$  width  $\rightarrow$  Pic

because Put Surjectivity does not hold.

(scaleNot and scaleBy satisfy Put Surjectivity,  
scaleBlank satisfies Put Injectivity and PutTwice)

PutInjectivity, PutTwice, PutSurjectivity  
are necessary conditions on  $\text{put}$ .

They are also sufficient for  
existence of corresponding  $\text{get}$   
that forms a well-behaved lens  
with  $\text{put}$ . (proof omitted)

(remembers:  $\text{get}$  is unique)

Put Get

Get Put

View Determination

Source Stability

Put Twice

Put Injectivity

Put Surjectivity

$\bigcirc \Rightarrow$  existence of *get*, so  $\bigcirc \Leftarrow \bigcirc$
